

Lesson Plan Template Teaching and Learning and Clinical Practice Courses

PRELIMINARY INFORMATION
TEACHER CANDIDATE: Jaspreet Missan DATE: 10-16-2024 GRADE: 2nd # STUDENTS: 25
UNIT/TOPIC: Unit 1, Math Lesson LESSON # 3 and 5 OF 5
LESSON NAME: Solve one step word problems, Solve two step word problems

STANDARDS, OBJECTIVES, ACADEMIC LANGUAGE
CONTENT STANDARDS (Math) (ELA) (Social Studies) (Science): List the academic content standards (include both number and text) (e.g., Common Core State Standards, Core Content Connectors, NGSS standards). If only a portion of a standard is addressed, then only list the part or parts that are relevant.
CCSS.Math.2.OA.1: Use addition and subtraction within 100 to solve one- and two-step word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem. CCSS.Math.2.OA.2: Fluently add and subtract within 20 using mental strategies.2 By end of Grade 2, know from memory all sums of two one-digit numbers. CCSS.Math.2.NBT.5: Fluently add and subtract within 100 using strategies based on place value, properties of operations, and/or the relationship between addition and subtraction.
CALIFORNIA ENGLISH LANGUAGE DEVELOPMENT (ELD) STANDARDS (Interacting, How English Works, Foundational Literacy): List the standard(s) (include both number and text) that are most relevant to the lesson.
ELD.P1.12.C.1.Ex: Selecting and applying varied and precise vocabulary and language structures to effectively convey ideas. ELD.P1.8.B.1.Ex: Analyzing how writers and speakers use vocabulary and other language resources for specific purposes.
CONTENT LEARNING OBJECTIVE(S): Based on the content standards, write one or two content learning objectives that state what students should know and/or be able to do as a result of this lesson. Objectives MUST be: specific, measurable, and realistic.

- Students will be able to write their own subtraction word problems using examples from a number bond. - Students will be able to solve subtraction word problems. - (UDL Checkpoint 8.1: Clarify the meaning and purpose of goals)
STUDENT-FRIENDLY LEARNING GOAL(S):
- I will be able to understand subtraction word problems and create my own word problem story.
LANGUAGE OBJECTIVES: Based on the ELD standards, write one or two language objectives that state how students' English language development will be supported through this lesson. Consider how you might include objectives that meet the needs of students at different proficiency levels (emerging, expanding, bridging, lifelong learning)
- Students will be able to use the academic language necessary to understand this lesson, by completing their word problem story.

Updated August 2024

CSUSM School of Education | Multiple Subject

STANDARDS, OBJECTIVES, ACADEMIC LANGUAGE
ACADEMIC LANGUAGE: Identify the language demands of the lesson. Detail the level and complexity of the texts being used, as well as the key vocabulary students must understand in order to participate effectively in this lesson.
The students are expected to use/understand Math terminology for addition and subtraction: Addition- "in all, give more, get/got, more" Subtraction- "fewer, left, give away, took away, less"

STUDENT DATA (Current Performance)	
Prior Knowledge and/or Pre-lesson assessments (i.e.: questionnaires, concept inventories, anticipation guide, open ended questions, graphic organizer, entrance tickets)	- Two-step word problem quiz - Addition word problem story

Performance Level	Before Lesson <i>Current Performance</i> (Student Names & % of all students)
Exceeds Standards	Trapezoid Group: - Hudson - Serena - Madeline - Eli - Amu - Trae - Mario - Finn - Jacksen
Meets Standards	Triangle Group: - Scarlett - Rocco - Daniel - Teagan - Liv - Grace - Lucas - Kalani
Approaching Standards	Circle Group: - Ronin - Ben - Marie - Ava - Tayley
STUDENT DATA: How will you use this data to inform the instructional approach (whole group, small group, rotations, individualized)? Which co-teaching approach supports and aligns with the data for this lesson? How might this data influence the lesson plan to support all learners Universal Design for Learning (UDL) principles?	
Based on the data I have collected, I will begin my instruction in the whole group to go over some of the mistakes that were made during the pre-assessment. Then I will switch into a small group to be able to provide extra help to the students in the circle group.	
Specific UDL supports & extensions planned	- Students who don't feel comfortable sitting on the rug are welcome to sit in their desks (Checkpoint 7.1)

	- Some students need to use a clipboard to help them keep their papers in place, so those are available to them. (Checkpoint 4.2) - Most of the students are not able to sit in one spot for too long, so the lesson is designed in a way where they will be switching from the rug back to their desks.(Checkpoint 6.2)
Planned Assessments Formal and Informal (i.e.: Turn & Talk, Think-Write-Pair Share, Thumbometer, graphic organizer, Summary, ABC Chart, Sorting Activities, Concept Maps)	- At the end of the lesson, the students will write their own word problem that I will collect and look over to see how much they understood from the lesson.

STRATEGIES AND LEARNING TASKS	
LAUNCH/HOOK/ENGAGEMENT(Opening): How will you start the lesson to connect with what students have already learned and know (activate background knowledge)? How will you integrate what you know about your student's academic knowledge, social development, funds of knowledge, and cultural backgrounds to engage the students from the start?	
I will begin this lesson by telling the students that they get to be the teacher for today's math lesson because they are going to get a chance to write their own word problems. Although they already did this with Math, this time they will be able to pick their own numbers if that is something they wish to do. This way they will really feel like the teacher and will be able to show if they understand certain subtraction rules.	
LESSON SEQUENCE(Middle): Specify the sequence of activities that will scaffold your students' learning toward the objectives. What will students be doing? Think specifically about what questions you will ask, in what activities students will engage, how you will promote discussion, and how you will facilitate students' use of key academic language. As you write this section, be sure to design your instruction to support <i>all</i> learners in your classroom (i.e., use universal design principles: engagement, representation, action & expression; accommodations and modifications) What formative assessments will you use for each activity to inform lesson effectiveness?	
Teaching Strategies/Learning Tasks/Activities	Formative Assessment(s)

- I will begin by incentivising the students with shining star tickets and lots of Dojo points in order to ensure that they are being respectful throughout the lesson.
- The lesson will start off with the students on the rug and I will begin by reviewing the difference between an addition number bond and a subtraction number bond.
- I will point out that a subtraction number bond has one part and the whole number at the top (which should tell the students to subtract the smaller 'part' number from the bigger 'whole' number, versus an addition number bond that shows both parts but it has the whole number missing (which should tell the students they need to add both of the parts to get the whole number.)
- Next, I will show them an example of a word problem for subtraction and we will set up the number bond together.
- Next, I will tell them that they are going to create their own word problems using the magic math words for subtraction.
- I will also tell the triangle and trapezoid groups to first write their word problems, then to solve it, and lastly to share their problem with a friend and explain what they did to solve it.
- After this, the two groups can put their stories in the turn-in bin and work on ST math on their computers.
- I will dismiss the triangle group to get started first and let them know that they could either use the number bond examples from the board or choose their own numbers to use in their subtraction stories (This will be their added challenge).
- Next, I will dismiss the trapezoid group to go back to their desks and to begin writing their subtraction story. I will let them know to try and make their story a two-step word problem (this will be their added challenge.)
- Lastly, I will ask the circle group to stay on the rug with me so I can review a subtraction problem with them before they begin writing their story (this will allow me to spend more time with them in order to make sure they understand the lesson.) The subtraction story will be their exit ticket to go back to their desks, finish working on it, and then begin transitioning into the next part of the school day.

- This will be displayed on the slides that I prepped for this lesson.
- The magic math words are displayed on the class note-taker.
- I will give the students a reminder to ask a question at the end of the story which tells the student what they are looking for.

CLOSURE(Closing): How will you bring closure to the lesson?

- Before the students split off to do their individual work, I will have them take off their imaginary student hat and put on their imaginary teacher hat to help them play the part. Then I will quickly remind them of the subtraction rules we just went over by asking them to remind me about some of the things we went over together because they are now the teacher. Then, they will be dismissed to work on their exit ticket.

CSUSM School of Education | Multiple Subject

What questions and/or prompts might you use to support **students in articulating/sharing their learning?**

How will you preview what will come next for the students in regard to the subject matter?

- Can you point out the magic math words in this problem?
- How do we know this is a subtraction problem?
- How do you know which number comes first when you set up a subtraction equation?

RESOURCES AND MATERIALS: What materials will you need for this lesson? What materials will students need?

- Subtraction story worksheet
- Pencils
- Clipboards for students who prefer to use them

If appropriate, the lesson may include a rubric for the formative assessment. If so, the chart below may be used. The objective(s) listed at the left, followed by brief descriptions of the criteria for each rubric score.

Rubric & Success Criteria for Formal Formative Assessment

3 = Exemplary/Accomplished 2 = Proficient/Achieving 1 = Developing/Emerging

Lesson Objective(s)	3 Exceeding	2 Meeting	1 Approaching
Category #1 (Are students using the appropriate math words in order to construct their word problem)	Students are able to recognize words such as: give away, less, or left as hints to subtract and are also using them correctly in their own word problem story. Students are also able to come up with their own magic math words.	Students are able to recognize words such as: give away, less, or left as hints to subtract and are also using them correctly in their own word problem story.	Students struggle to recognize the magic math words and need assistance in structuring their word problem stories.

Category #2 (Are students able to understand that the bigger number needs to be mentioned first in a word problem)	Students are able to recognize that the bigger number is supposed to be mentioned first and goes first in a subtraction equation. Students also understand that a subtraction number bond shows the bigger number as the 'whole' and the smaller number as the 'part' and that they are looking for the other 'part' as the answer.	Students are able to recognize that the bigger number is supposed to come first in a subtraction equation.	Students are able to recognize that the bigger number comes first in a subtraction equation, but need help constructing their word problem to reflect the numbers they are using.
Category #3 (Are the students asking a question at the end of their word problem that tells the reader what they are solving for)	Students are able to effectively include a question at the end of a word problem story that clearly states what they are solving for.	Students are able to include a question at the end of their word problem story to close off their word problem.	Students are able to write a question at the end of their word problem story with some assistance and examples.

CSUSM School of Education | Multiple Subject

LESSON EFFECTIVENESS	
Post-Instruction Reflection with MT	
Post Lesson Assessments (i.e.: questionnaires, concept map, open ended questions, T/F questions, sorting activities, graphic organizer, exit tickets)	The post lesson assessment was the subtraction word problem story that they did on their own after I taught the lesson.
Performance Level	After Lesson Achievement (Student Names & % of all students)
Exceeds Standards	- Eli - Serena - Jacksen - Trae - Madeline - Hudson - Amu

	- Rocco - Grace - Sasha - Scarlett - Teagan
Meets Standards	- Lucas - Daniel - Kalani - Ronin - Jalen - Ari - Mario
Approaching Standards	- Liv - Ben - Ava - Finn
STUDENT DATA: What percentage of the students moved up a level? What percentage of the students moved down a level? What percentage of the students remained the same? How might his data inform future lessons?	
8/23 = 35% (Moved up a level) 13/23 = 56% (Remained at the same level) 2/23 = 9% (Moved down a level)	

LESSON REFLECTION (TC self-reflects after watching video of own teaching)	
Reflecting on your instruction: How did the instructional approach (teaching) align with student performance/lesson outcomes (learning)?	
What went well? What should remain? What might require enhancement?	What stalled learning? What might require adjustment? What might require removal?
- I think the timing of the lesson went well and I didn't take too much time to complete what I needed to teach and have the students do the assignment that corresponded with the lesson.	- I had some technical difficulties with the slides. They kept switching automatically, so next time I will try to make sure that doesn't happen by trying to use google slides instead of canva.

- I realized that I should keep some notes with me while I teach to make sure I am mentioning some things that I forgot about.
- I wanted the Triangle and Trapezoid groups to do the whole worksheet but I forgot to mention that to them before I dismissed them to do their work.
- I think I can also work on wording my explanations in a clearer way.
- I also told the students I was going to hand out stars to students who were being quiet and respectful during the lesson but then I forgot to do that, so I need to remember to do this next time.
- Next time, I will also try to find a better way to engage the whole class back in at the end for a better closure so the students can really compare how they did better than last time. I can do this by asking them to keep their worksheets with them so they can look at what they did on the other side last week and compare it to their work from the lesson they just learned.
- I am happy about how long I kept the students on the rug because I finished up right before they began getting fidgety and they were able to go back to their desks for the next part of the lesson.
- The examples that I left on the board were also a bit unclear because I wrote it down over a picture by accident, so I need to make sure that all the students can see those next time.
- Next time I will also ask more thumbs up and thumbs down

- I need to make sure I am properly addressing a student's question and making sure they understand what I said before I move on.
- When I was in the small group with the students who needed more guidance, I had to keep stopping what I was doing to get 2 of the students to stop playing with a pencil sharpener.
- Instead of asking them to put it down, I should have asked the student to put the pencil sharpener back on their desk.
- Next time, I also won't let the students choose their own numbers because they chose numbers that were way too big for them to solve. I will make sure they only use the examples that I provide them.
- The word problem that we went over may have also been a bit too easy for the students that are at a higher math level, so next time I will incorporate a word problem that challenges them a bit more. This will help keep them engaged as well.
- I need to make sure the content is at a good level to where it's not too easy and not too hard either.

questions in order to engage more students because there were only a few of the same kids raising their hands this time. - Next time I will also try to engage the students who were completely tuned out and try to call on them or ask them questions to pull them back into the lesson. -
