

Instructional Component Template:

Objective for this Assignment (40 Points):

The instructional component is the second part of a larger lesson planning assignment, building on the first part (assessment component). This segment focuses on designing a comprehensive lesson guided by Universal Design for Learning (UDL) principles, with clear success criteria and regular, meaningful assessments. The goal of the instructional component is to showcase your ability to plan effectively for a specific group of students using UDL teaching practices.

What Students Will Learn: List the content standard(s), Learning Objective, and Student Friendly Goal for this lesson. (6 Points):

- Common Core State Standards:

CCSS.Math.2.NBT.5: Fluently add and subtract within 100 using strategies based on place value, properties of operations, and/or the relationship between addition and subtraction.

- Learning Objective:

Students will be able to write their own subtraction word problems using examples from a number bond.

- Student Friendly Goal:

Students will be able to write their own subtraction word problems using examples from a number bond.

Lesson Opening Hook/Launch (6 Points): Please use at least 3 of these strategies

- **Create Real-Life Connection:** Start with a relatable, real-world scenario linked to the lesson topic.
- **Engage with Students' Lives:** Use examples that reflect students' interests, culture, or community experiences.
- **Noticing and Wondering:** Show an image and ask students to quietly think of one thing they notice and one thing they wonder, then share with a partner.
- **Trigger Curiosity:** Have a few students share their thoughts to build interest.
- **Connect to the Lesson Objective:** Explain how the scenario links to the lesson skill and its real-life use.
- **Encourage Active Participation:** Give students opportunities to "assist" or lead during the lesson as experts in the scenario.
- **Connect to Prior Knowledge:** What have students already learned about this?

Encourage Active Participation: I will begin this lesson by telling the students that they get to be the teacher for today's math lesson because they are going to get a chance to write their own word problems.

Connecting to Prior Knowledge: I will begin by reviewing the difference between an addition number bond and a subtraction number bond.

Create Real-Life Connection: The example word problem will include a couple of the students' names that need some extra help getting engaged into the lesson. (They are always excited when their names are used).

Engage/Action: Specify the sequence of activities that will support your students' learning toward the objectives (6 Points):

- What activities will the students be involved in during the lesson to support their achievement of the objective(s)
- How will you promote discussion? LIST specifically about what questions you will ask.

- The students created their own word problems after the lesson to show their understanding of Subtraction word problems.
- Doing a Word Problem as a class: Walking through the problem together will help remind students of what they need to look for in a word problem to help them solve it and it will also help me recognize which students have a good understanding of the lesson and which students are on their way to becoming proficient word problem solvers.
- Throughout the lesson, I will ask the students what clues they can look for in order for them to be able to tell that they need to subtract. Once they give their answers, I will point out that subtraction word problems have “magic math words” that help them know if they need to add or subtract. (Hopefully the students say “magic math words” and are able to point some out in the problem on the board).

Questions to Promote Critical Thinking:

- “What are the magic math words in this problem?”
- “Are the math words telling us to add or subtract?”
- “Why does the bigger number have to come first in a subtraction equation?”

Supporting Diverse Learners (12 Points):

Directions for Including UDL, Accommodations, and Modifications in Your Lesson Plan

- **Describe UDL Principles:**
State how the tasks and strategies in your lesson plan create access points for specific students using UDL principles, accommodations, and modifications.
- **Highlight Accommodations and Modifications:**
Emphasize decisions to incorporate accommodations and modifications based on the needs outlined in students' IEPs, 504 plans, or EL goals.
- **Provide Rationale:**
Add comments explaining the rationale behind instructional decisions, specifying which students are targeted and how the accommodations and modifications are integrated into the lesson.
- **Cite UDL Standards:**
Next to each activity or part of the lesson plan that includes UDL support, cite the relevant UDL standard.
- **Make UDL Standards Stand Out:**
Change the font color or highlight the UDL standards to ensure they are easily visible within the lesson plan.

- **Checkpoint 7.3: Minimize Threats and Distractions:** Students are on the rug for the first part of the lesson in order for them to be able to focus on the problems on the board without being distracted by the things in their desks.
- **Checkpoint 1.2: Offer Information in Multiple Formats:** A slideshow is used in this lesson (along with visual aids). This is supported by oral instruction. This is helpful for both auditory and visual learners. I will also use the smart board to draw number bonds on the screen to demonstrate how to set up the problem when they switch to working on their own.
- **Preferential Seating for a Student with a 504/IEP:** Students who have trouble staying in one spot for too long are welcome to sit at their desks or the rug during the lesson and are welcome to switch according to their needs throughout the lesson.
- Clip boards are also provided for students who need some support to keep their paper in one place, so they can write easily.

Rationale:

- Minimizing distractions helps students engage in the lesson easier and allows their mind to focus on one thing at a time without having to worry about something else.

- Offering students visual and auditory formats of teaching helps the teacher to have higher engagement in the class, as more students have their learning needs met. If students' learning needs are met, there is a higher chance of them being successful in understanding the lesson that is being taught.
- Providing students with tools, such as clipboards, to help them keep their papers in place helps the students have less to worry about as they are doing their work.

Reflection (10 Points)

Reflect on your experience incorporating UDL principles, accommodations, modifications, and supports into your lesson plan. In 1 page, independently address the following:

- **Decision-Making Process:** Describe how you included UDL principles, accommodations, modifications, and technology (if applicable) in the lesson.
- **Impact on Your Approach:** Reflect on how these elements shaped your thinking about providing access for all students.
- **Provide Specific Examples:** Use specific examples of UDL strategies, modifications, or accommodations and explain their support for diverse learning needs.

Planning with UDL principles made it easier for me to shape my lesson a certain way. I knew exactly what my students needed in order to make it easier for them to be engaged in the lesson. Being able to work with them and getting to know them better before the lesson allowed me to note down what specific needs my students have. This allowed me to have a clear idea of how the lesson needed to be structured and what needed to be included to make the process less overwhelming for the students.

Decision Making Process:

I knew my students needed visual support in order for them to be more engaged in the lesson and to help them visualize word problems better. In order to do this, I included pictures of items that were mentioned in the word problem. For example, if I mentioned '6 pumpkins,' I included a picture of six pumpkins. I also included a visual of what a number bond looks like and I used the smart board to fill in the numbers in the appropriate spots along with the students.

Clipboards were also provided to students who need a little help keeping their paper in place while writing. This allows for those students to be able to write and focus on the work they are doing without worrying about keeping their paper in one spot and getting frustrated when it keeps sliding off of their desks.

Some of my students also find it more comfortable to be able to move from one spot to the next more frequently, so I allowed students to move from the rug to their desks if they needed to and also move back whenever they felt comfortable.

Impact on my Approach:

After the lesson was over I sent the students back to their desks to work on a worksheet where they had to create their own subtraction word problem. I had an idea of which students would need extra help beforehand and I sat with those students at the teacher table to help guide them through the worksheet. This allowed me to have an idea of how much these students understood from the lesson and how I can further assist them in the future.

I excused the students to go work based on the math groups they are already assigned to. This way, the group that was working with me did not feel like they were the only ones in their math group. Each group was assigned an extra step to their word problem based on their understanding of the lesson and how they have done

on previous math lessons. The group of students that I worked with also tend to get overwhelmed when doing math on their own. Doing it with a teacher helps the students feel more confident about tackling the assignment provided for them.

Specific Examples:

Some useful strategies to help teach students about subtraction was the use of 'number bonds.' This visual allowed students to see that in subtraction there is a 'whole' number and a 'part' of it which represents the smaller number in the equation. Once the students can see that they are taking a certain amount away from the whole number (using one of the parts/smaller number in the equation) in order to get the missing part, they can begin to write their equation and use a strategy to solve the problem.

After the students solved the equation we set up together, I asked for volunteers to share their strategies with me. Verbally expressing their thinking process allows the student to review the work they did and also gives other students a chance to hear how their peers went about solving the same problem. This way the students also get to listen to someone other than the teacher. As the student explained what they did to solve the problem, I wrote their strategy on the board so students got to hear the process and see it as well.

After hearing from about three students, I explained to the students that they get to be the teacher now and create their own subtraction word problems like the one we did together on the board. This got the students really excited to do the assignment and allowed them to have fun with it as well. Doing this also made the math lesson seem less intimidating, and the students went into the assignment feeling more confident. Overall, planning this lesson helped me learn that lessons have to be catered specifically to your students and the same lesson may not work for other classes without some UDL adjustments. Every student is unique and special, and lessons have to be taught accordingly.
